# Commentary for my game Project.

**I have included included platforms my in my project moreover I have made enemies using simple shapes and making it interesting keeping the code simple also I have made flagpole in my project as the character reaches the flagpole it rises in the air signaling that the player has completed the level.Also there are text that are displayed in my project such as after all the lives end and after completing the level.**

In this commentary, I'll dive into the adventure of crafting a nostalgic game starring everyone's favorite sponge, Sponge Bob. First off, imagine infusing Sponge Bob's world with life by adding subtle nuances like different facial expressions based on his actions. Picture the excitement of hearing familiar sounds when Sponge Bob is walking. I expanded the game's features by incorporating various extensions, by integrating different sounds for specific actions such as collecting items, jumping, and colliding with enemies. These extensions added depth and immersion to the gameplay experience, enriching the overall ambiance of the game environment.

But making the game wasn't all fun and games. I had some tricky parts to figure out. Notably the creation of platforms and implementing logic for character-enemy collisions. Designing the platforms required meticulous attention to detail to ensure they were appropriately positioned and aligned for smooth gameplay. Moreover, implementing the game restart function upon character-enemy collision involved complex logical reasoning moreover crafting platforms demanded precision to place everything in place. Each piece meticulously positioned to ensure seamless navigation.I made sure players would have a blast playing the game

Through this game project, I deepened my grasp of game design principles,tackling tasks like character-enemy collision logic sharpened my logical thinking skills and I also discovered how to elevate player engagement and immersion, ultimately enhancing the overall enjoyment of the gaming experience.

In the end, as I reflect on the journey of creating this game, I feel a deep sense of accomplishment and fulfillment. It wasn't just about coding and designing; it was about bringing an idea to life, overcoming obstacles, and learning along the way.
